Speech Therapy and Functional Jaw Orthopedis Course

The 7th edition of Speech Therapy and Functional Jaw Orthopedis Course will start on October 21st. At the Lisbon School we encourage a multidisciplinary practice with Speech Therapy and FJO course, since the connection between these practices is essential to a dynamic and interactive approach by identifying and avoiding complications or relapses in the treatment of malocclusion, thus promoting therapeutic success.

Functional Jaw Orthopedics National course

The 8th edition of the national course will start on January 12, 2023 and we are already organizing the group. This course has a high clinical component, corresponding to about 50% of the workload, with active participation in clinical cases. We will share our clinical experiences, always based on the friendship and companionship that characterize us. Don't miss this opportunity and sign up for the course.

Functional Jaw Orthopedics course - B-learning (in portuguese and english)

Learn anywhere in the world without leaving your home!!!

The Lisbon School has available a Functional Jaw Orthopedics Course in English and Portuguese, with 10 online modules and 2 classroom modules (with a clinical component) Come learn functional orthopedic techniques, through individualized training at your own pace. This course is supported by videos, worksheets, clinical cases and synchronous sessions with a tutor and the possibility to watch the classroom modules via zoom.

CLINICAL CASE
58,4 YEARS OLD, FEMALE PATIENT

JUNE 2019 SEPT. 2021 JUNE 2019 SEPT. 2021

1.1 - INTRA-ORAL PHOTOGRAPHS

1.2 - PANORAMIC RADIOGRAPHY R L SEPT. 2021

DIAGNOSTIC

A 58.4-year-old female patient with Temporomandibular Disorder with severe pain in the right TMJ, difficulty in opening the mouth and pain during chewing. The MRI showed a straightening and irregularity of the condyle in the right TMJ, with important degenerative and osteoarthritic changes and anterior marginal osteophytosis. It also shows an anterior dislocation of the articular disc and abundant effusion of the upper compartment. With mouth opening, there was no reduction in the dislocation, with an anterior thrust of the articular disc with moderate blockage.

TREATMENT

The patient was treated for a period of 24 months with 2 functional orthopedic appliances. An SN 20 for 12 months, followed by PIPS for another 12 months.

CLINICAL RESULTS

The patient stopped having pain in the right TMJ and during chewing and recovered a physiological mouth opening amplitude. The MRI at the end of the treatment showed that there was no fluid in the joint, which explains the absence of pain from inflammation and, although the anterior dislocation of the disc is maintained, there is no blockage in the opening and closing movement.
